### Application Circuits

**Note:**  $C_{in}$  and  $C_{out}$  are  $0.47\mu F$  low ESR ceramic capacitors

### Block Diagram

### Functional Description (Refer to Block Diagram)

#### Output Voltage

The divided output voltage is compared with the internal reference voltage by the error amplifier with internal phase compensator. The output of the error amplifier then drives the P-channel MOSFET to maintain a stable and constant output voltage.

#### Low ESR Capacitors

The internal phase compensator maintains the stable output voltage with low ESR ceramic input and output capacitors. 0.47 $\mu$ F low ESR (X5R/X7R) ceramic capacitor located as close as possible to the IC's pins is recommended.

#### Current Limit and Thermal Shutdown Protections

Current limit protection is used to limit the output current when an overload condition occurs. As a result, the output voltage will drop. Thermal shutdown protection will turn off the output to reduce the power dissipation when the operation junction temperature exceeds 170  $^{\circ}$ C.

#### EN Pin

The output of the regulator in PT7M8218 can be controlled with EN pin. The EN pin should be connected to a "VIN" or a "GND" voltage as a floating input applied to inverter input of the enable circuitry will increase the current consumption.

#### NOTE ON USE

Please use this IC within the stated absolute maximum ratings.

Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current.

Please keep the resistance low between VIN and GND wiring in particular.

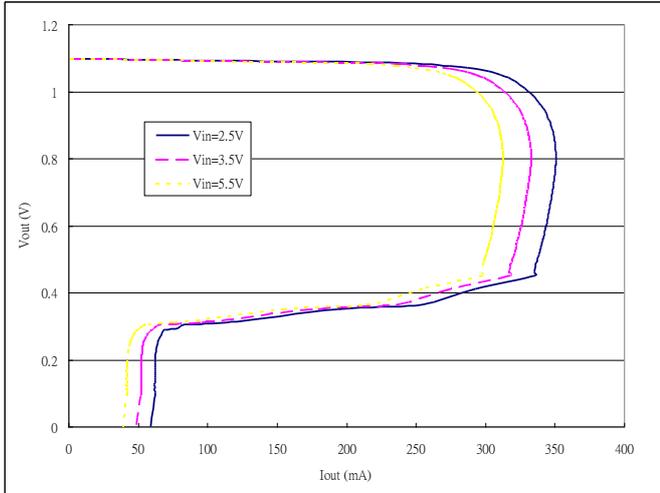

Please wire the input capacitor (C<sub>in</sub>) and the output capacitor (C<sub>out</sub>) as close to the IC as possible.
